

# Artifact Size Plugin

## Deprecated

Deprecated since SonarQube 5.0

## Description / Features

This plugin is used to measure and record the size of the project artifact.

On a dashboard:

**Artifact Size : 59 Kb**

On a TimeMachine widget:

<input type="checkbox"/> Artifact Size(Kb)	59	59	
--	----	----	--

By default, on a Maven project, the plugin retrieves the size on its own. Otherwise, a property should be set at the project or module level to pass the path to the artifact.

For example: `sonar.artifact.path=target/zip/myCustomArtifact.zip`

## Installation

1. Install the plugin through the [Marketplace](#) or download it into the `SONARQUBE_HOME/extensions/plugins` directory
2. Restart the SonarQube server

## Usage

Run a new quality analysis and the metrics will be fed.

## Known Limitations

This plugin requires that a build is run to generate the artifact prior to the SonarQube analysis.

In a multi-module environment, a property passed to the root pom will be used for modules.
