

Build Breaker Plugin

Unknown macro: {iframe}

Your browser does not support iframes.

Description / Features

This plugin will mark the build failed if the project fails its [quality gate](#). It is to be noted that the analysis does not stop if the quality gate fails; it continues successfully to the end. But the build status will report failure.

This plugin allows you benefit from the notifications built into CI engines.

Installation

1. Install the plugin through the [Update Center](#) or download it into the `SONARQUBE_HOME/extensions/plugins` directory
2. Restart the SonarQube server

Usage

1. Associate a quality gate to your project
2. Run a quality analysis on your project

Advanced Usage

By default this plugin is active on every project. But you can skip its execution on some of them by setting the `sonar.buildbreaker.skip` property to `true` at the project level. This property can also be set globally, so that it is off by default, but on for individual projects.

The property `sonar.buildbreaker.forbidden.conf` can be used to specify configurations that would break the build. For example, if you set in the `sonar.buildbreaker.forbidden.conf` property to `sonar.gallio.mode=skip`, each analysis on .NET projects executed with Gallio skipped would be marked "broken".
